EUREF Symposium 2005

Continued Development of GREF

Integrated German Reference Network GREF (densification of EPN):

- GPS/GLONASS
- Absolute gravity
- Tide Gauges
- Real-time networking
- Local backup networks

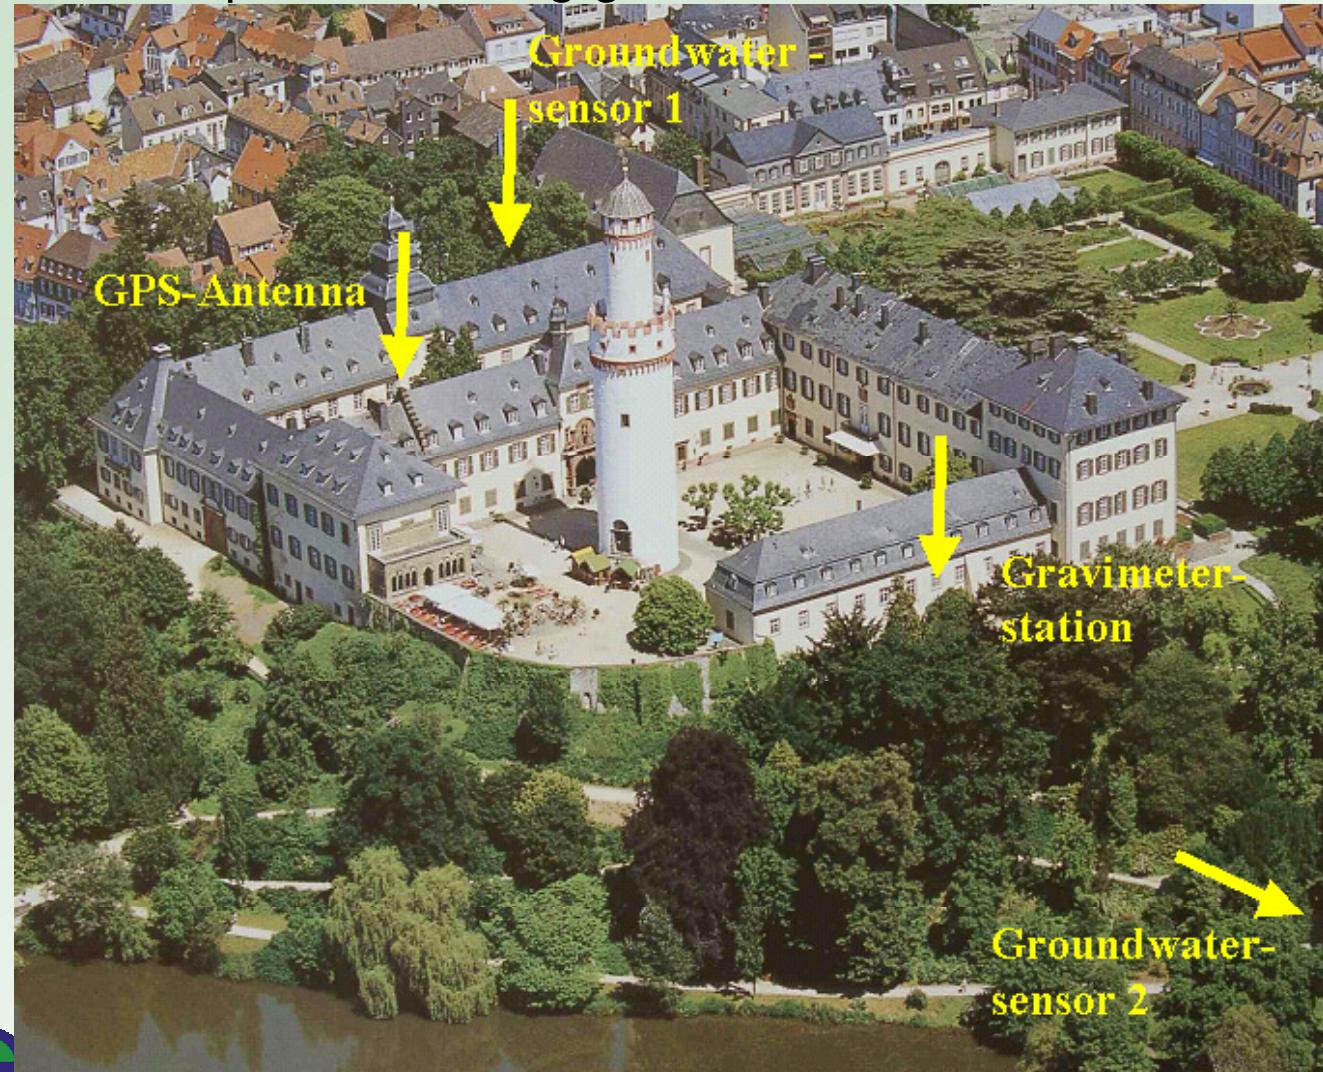

Main objective:

- Integration of GREF into EPN and basis for SAPOS monitoring

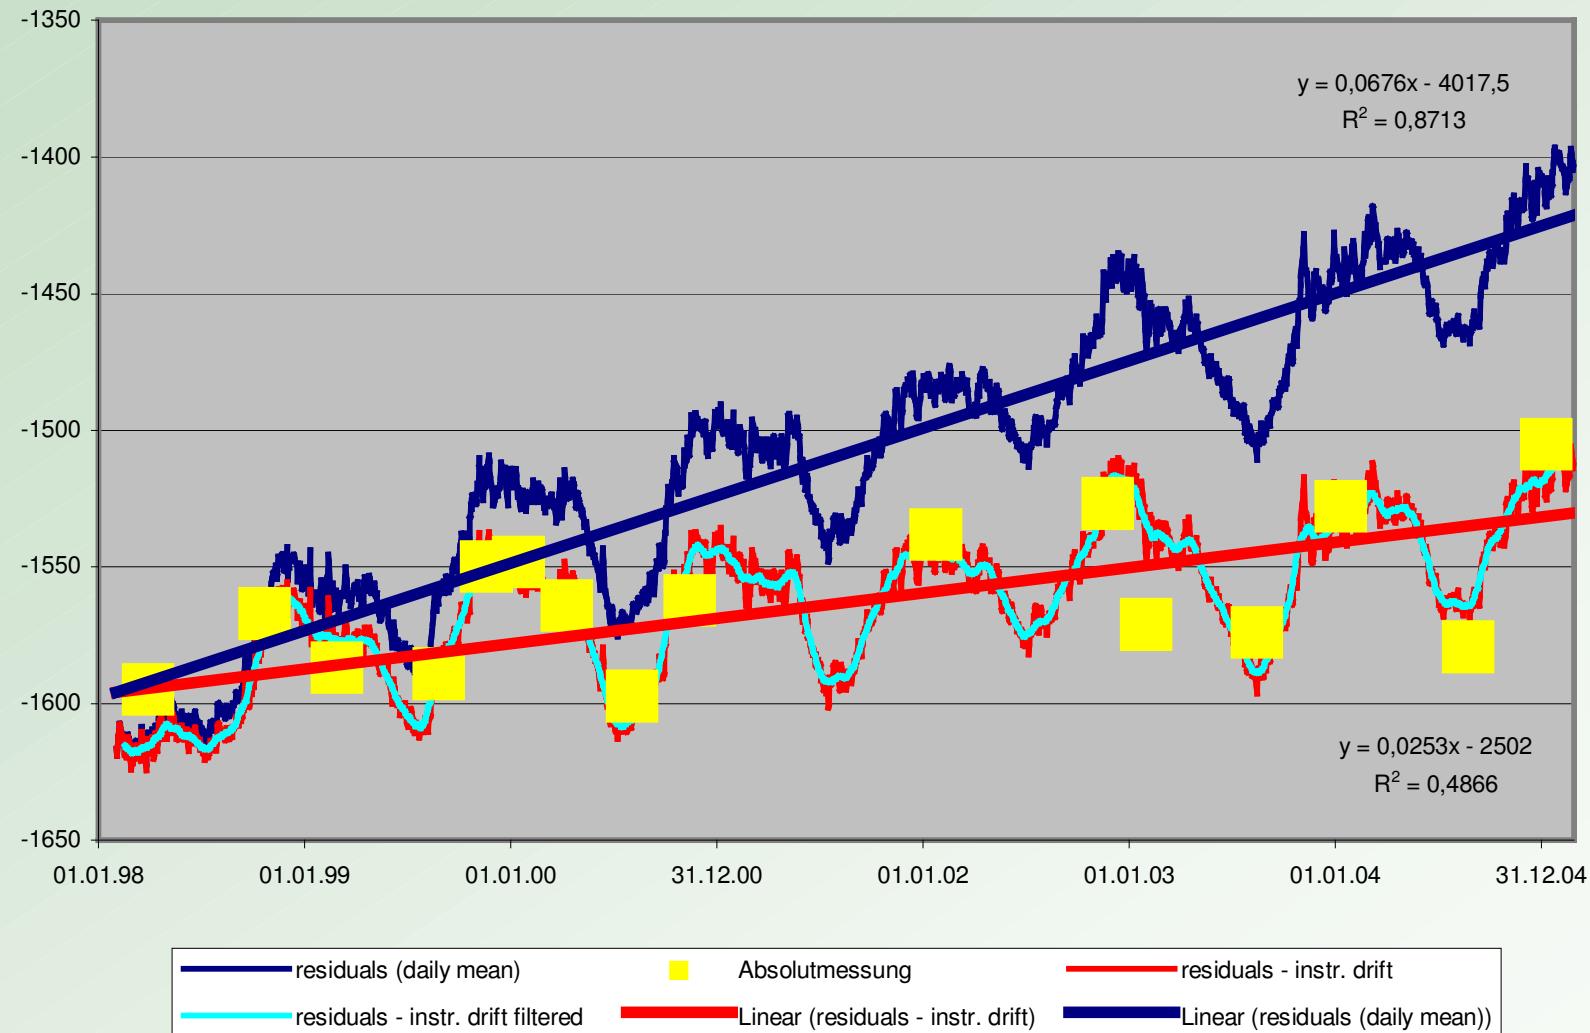

Gravity Reference System

Regularly performed absolute gravity measurements in combination with continuous registration of super-conducting gravimeters in

- Wettzell,
- Bad Homburg,
- Moxa and
- Medicina
(cooperation with university Bologna)

Separation of instrumental drift of SG and geophysical gravity change (Medicina)

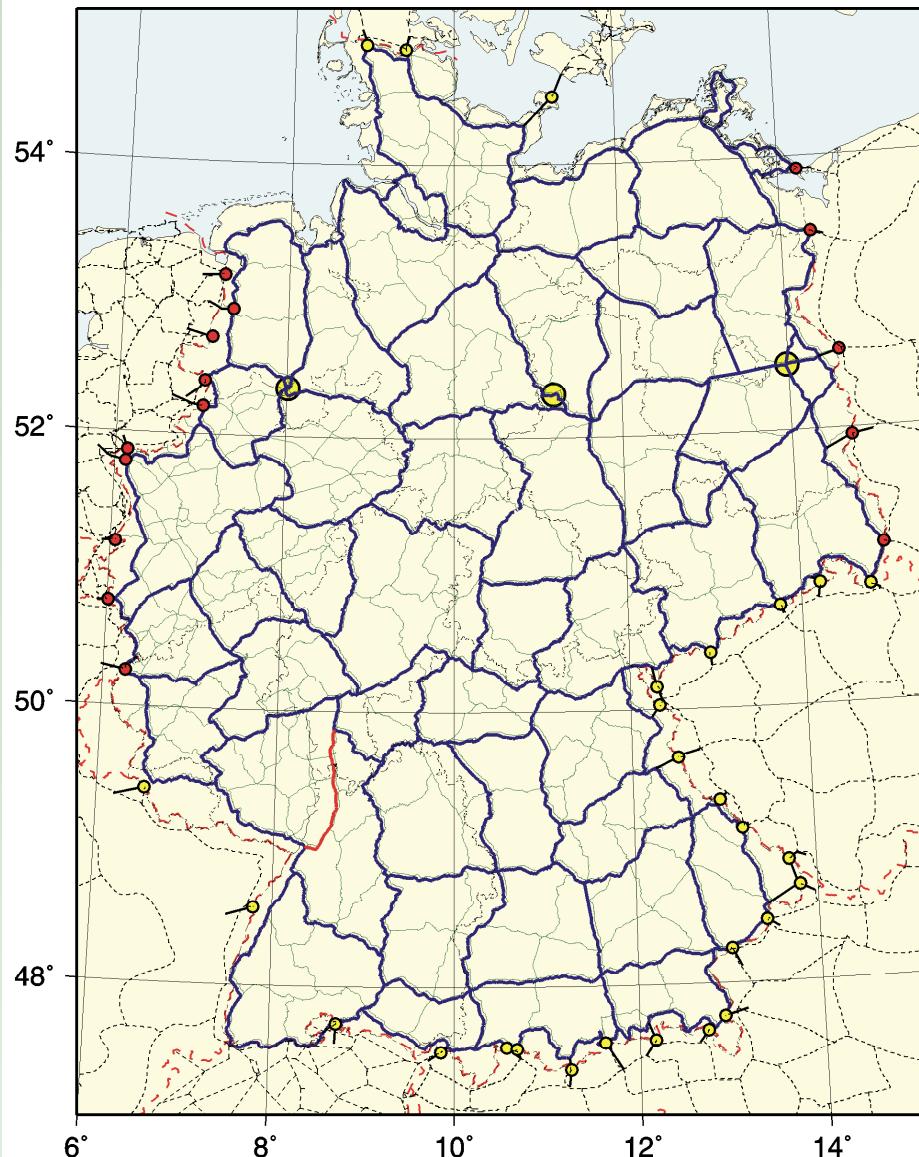

SAPOS Positioning Service

- ~260 permanently recording and networked reference stations in ETRS89
- Standard transmission medium for „cm“ accuracy is GSM, but some member authorities are testing in parallel the NTRIP method
- Establishment of the Central Office SAPOS in 2003 for management of German-wide activities
- Data exchange at the borders to 3 foreign countries (Netherlands, Switzerland and Austria) has been established, ongoing discussions with other countries

1st Order Vertical Control Network

- New measurement of DHHN92 from 2006 to 2010
- Digital geometrical precise levelling
- High-precision GPS measurements at stable points
- Absolute gravity determination at stable points

Objective:

- Precise geoid will improve satellite-based height determination
