

Near Real Time ZTD validation at E-GVAP Super Sites

Francesco Vespe, ASI/CGS Matera

Rosa Pacione, e-GEOS/CGS Matera

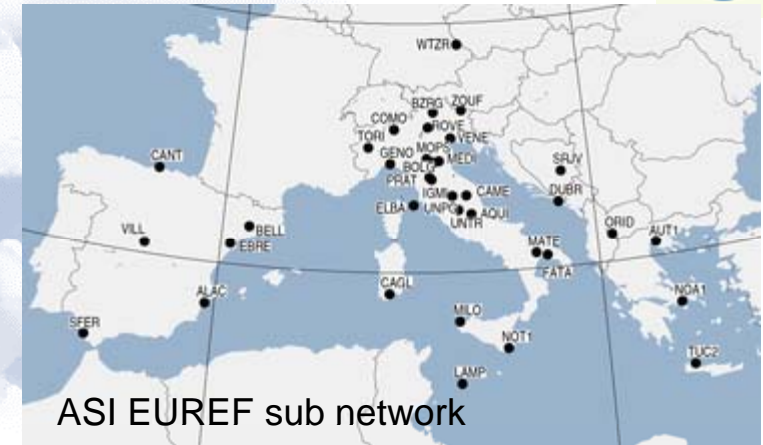

Brigida Pace, Sistemistica/CGS Matera

History

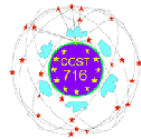

ASI/CGS has been involved in GPS data analysis of regional permanent network since September 1996 when its solutions were incorporated in EUREF.

ASI/CGS provides to EUREF final, rapid and hourly sinex files.

GPS-Meteo Projects

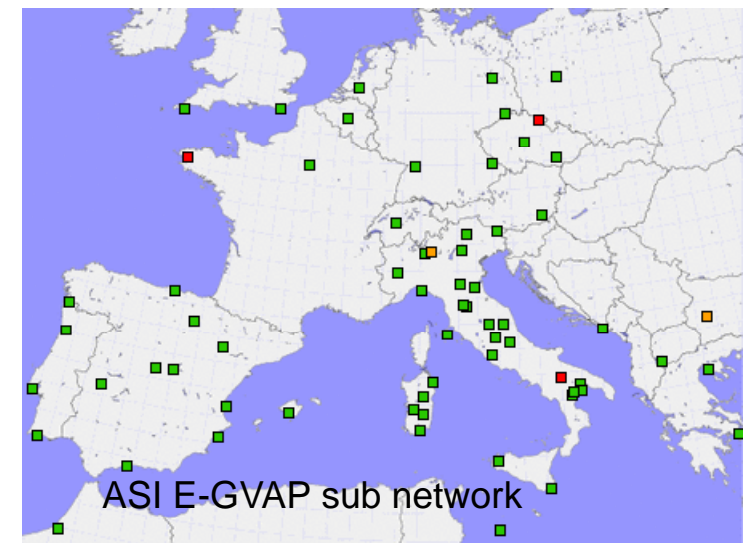

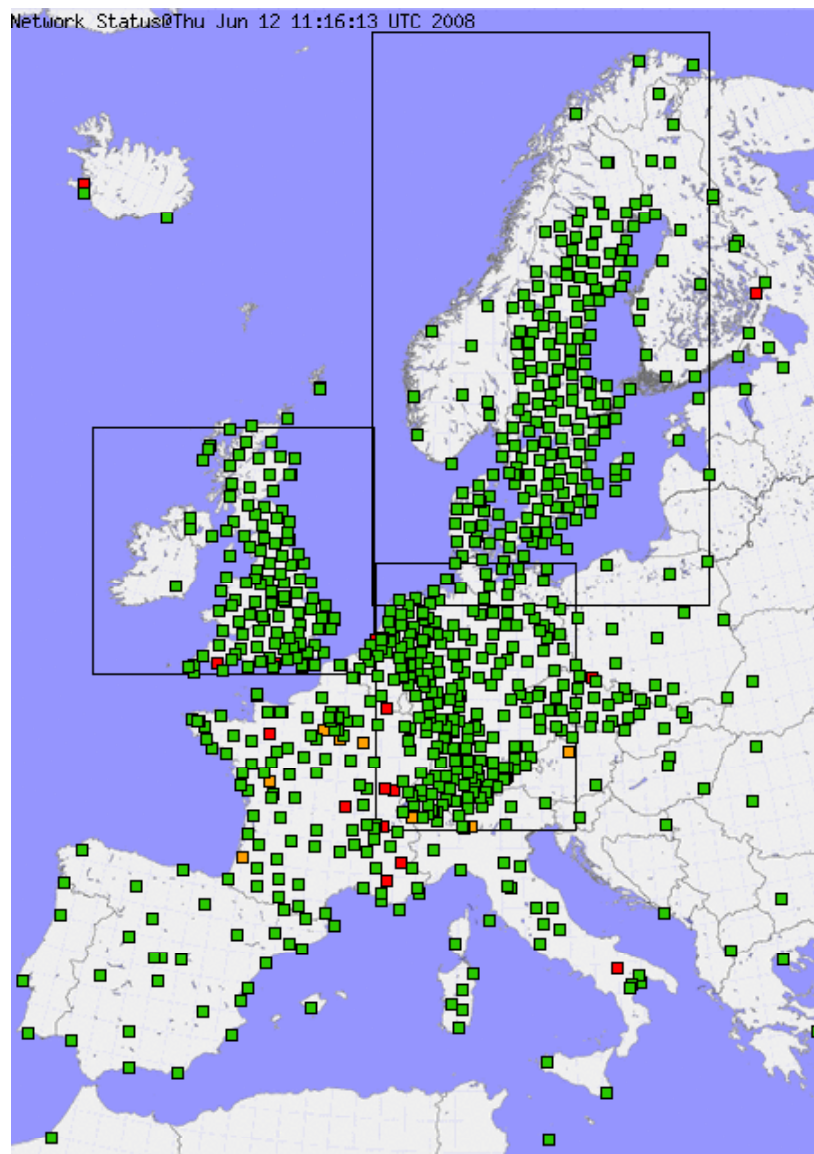

1999 MAGIC *develop and test the capacity for meteo organizations to benefit from GPS as new data source*

2001 COST-716 *NRT demonstration campaign*

2003 TOUGH *Targeting Optimal Use of GPS Humidity Measurements in Meteorology*

2006 E-GVAP *towards operational use and establishing a GPS delay observing system*

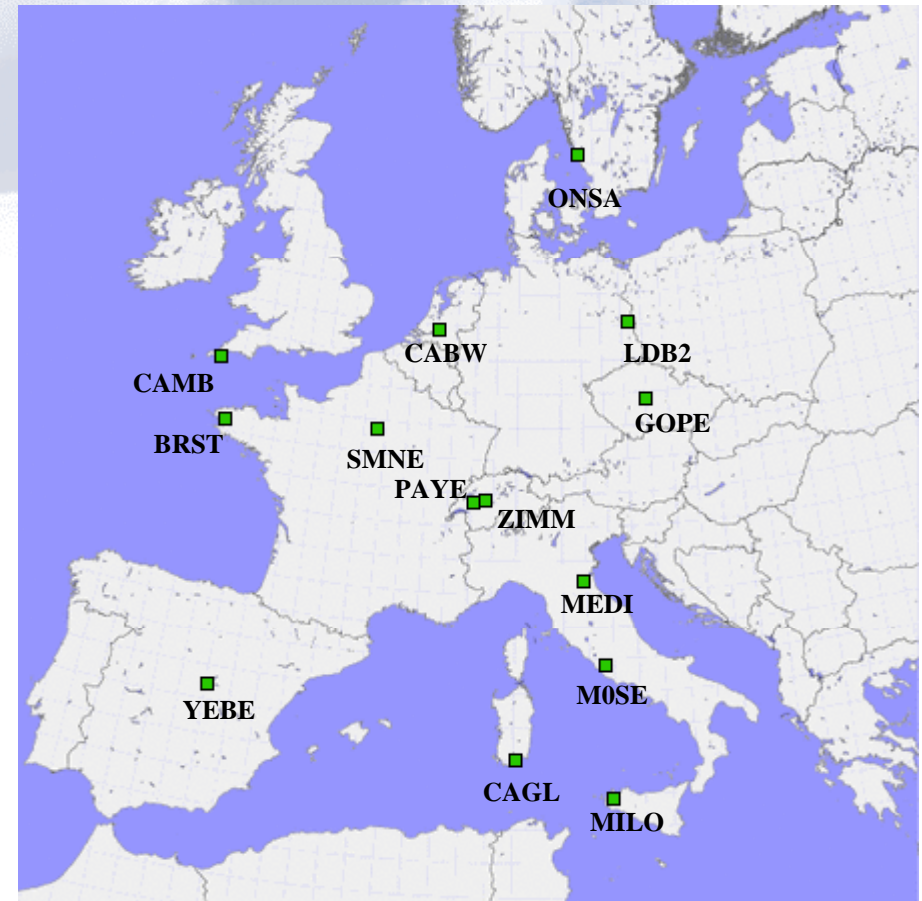

- 13 Institutions
- 10 ACs
- > 800 GPS sites
- ~ 200 analyzed at least by 2 ACs
- ~ 100 analyzed at least by 3 ACs

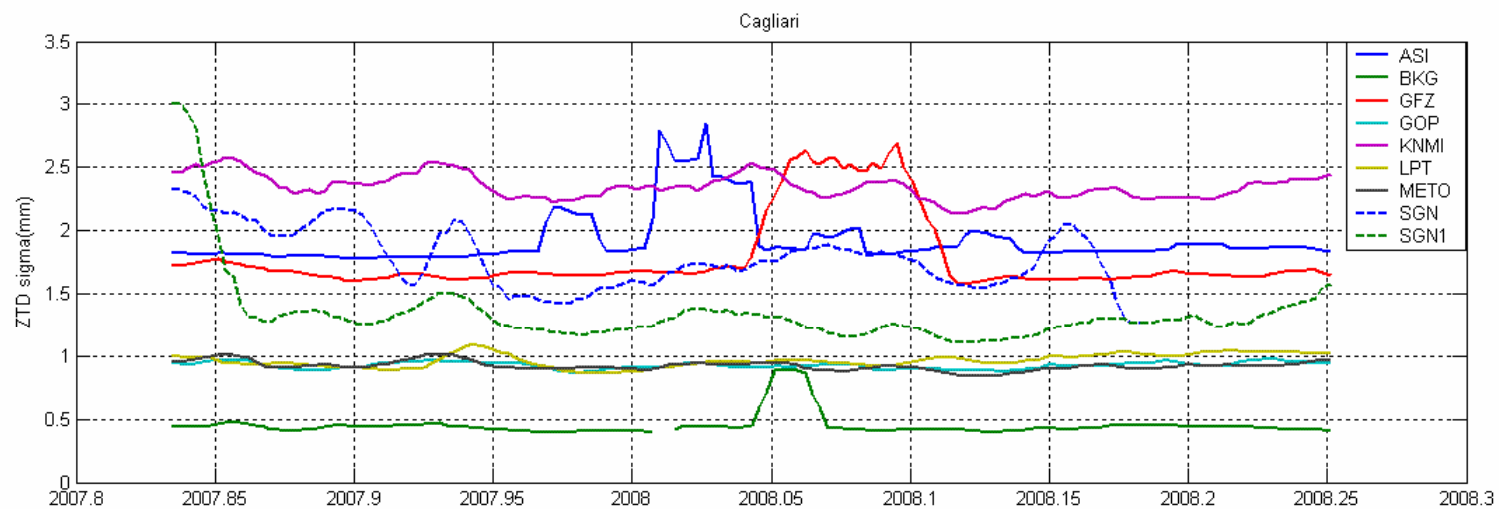

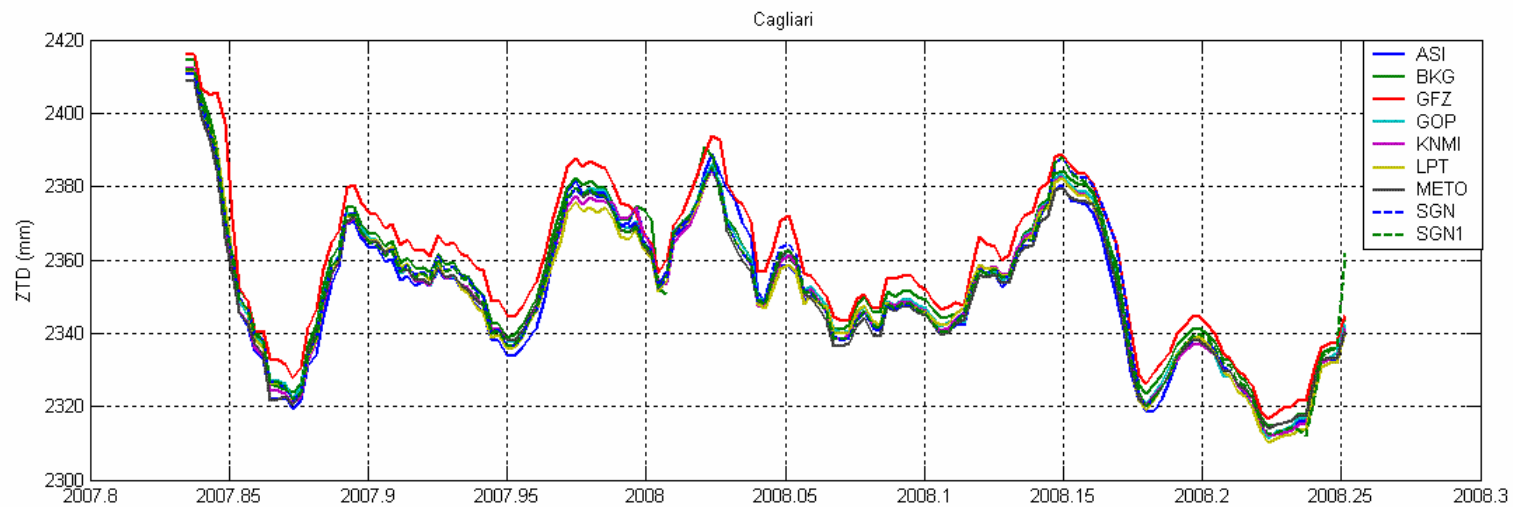

Based on a recommendation from the E-GVAP expert team on data processing a set of **Super Sites** has been introduced.

The Super Sites are co-located with meteorological equipment (radiosonde and/or water vapour radiometer).

Comparisons are made between AC solutions and validation performed against independent meteorological observations as well as against numerical weather prediction model data.

Cagliari Super Sites: Time Series November 2007- March 2008

Super Sites Coordinate Repeatability

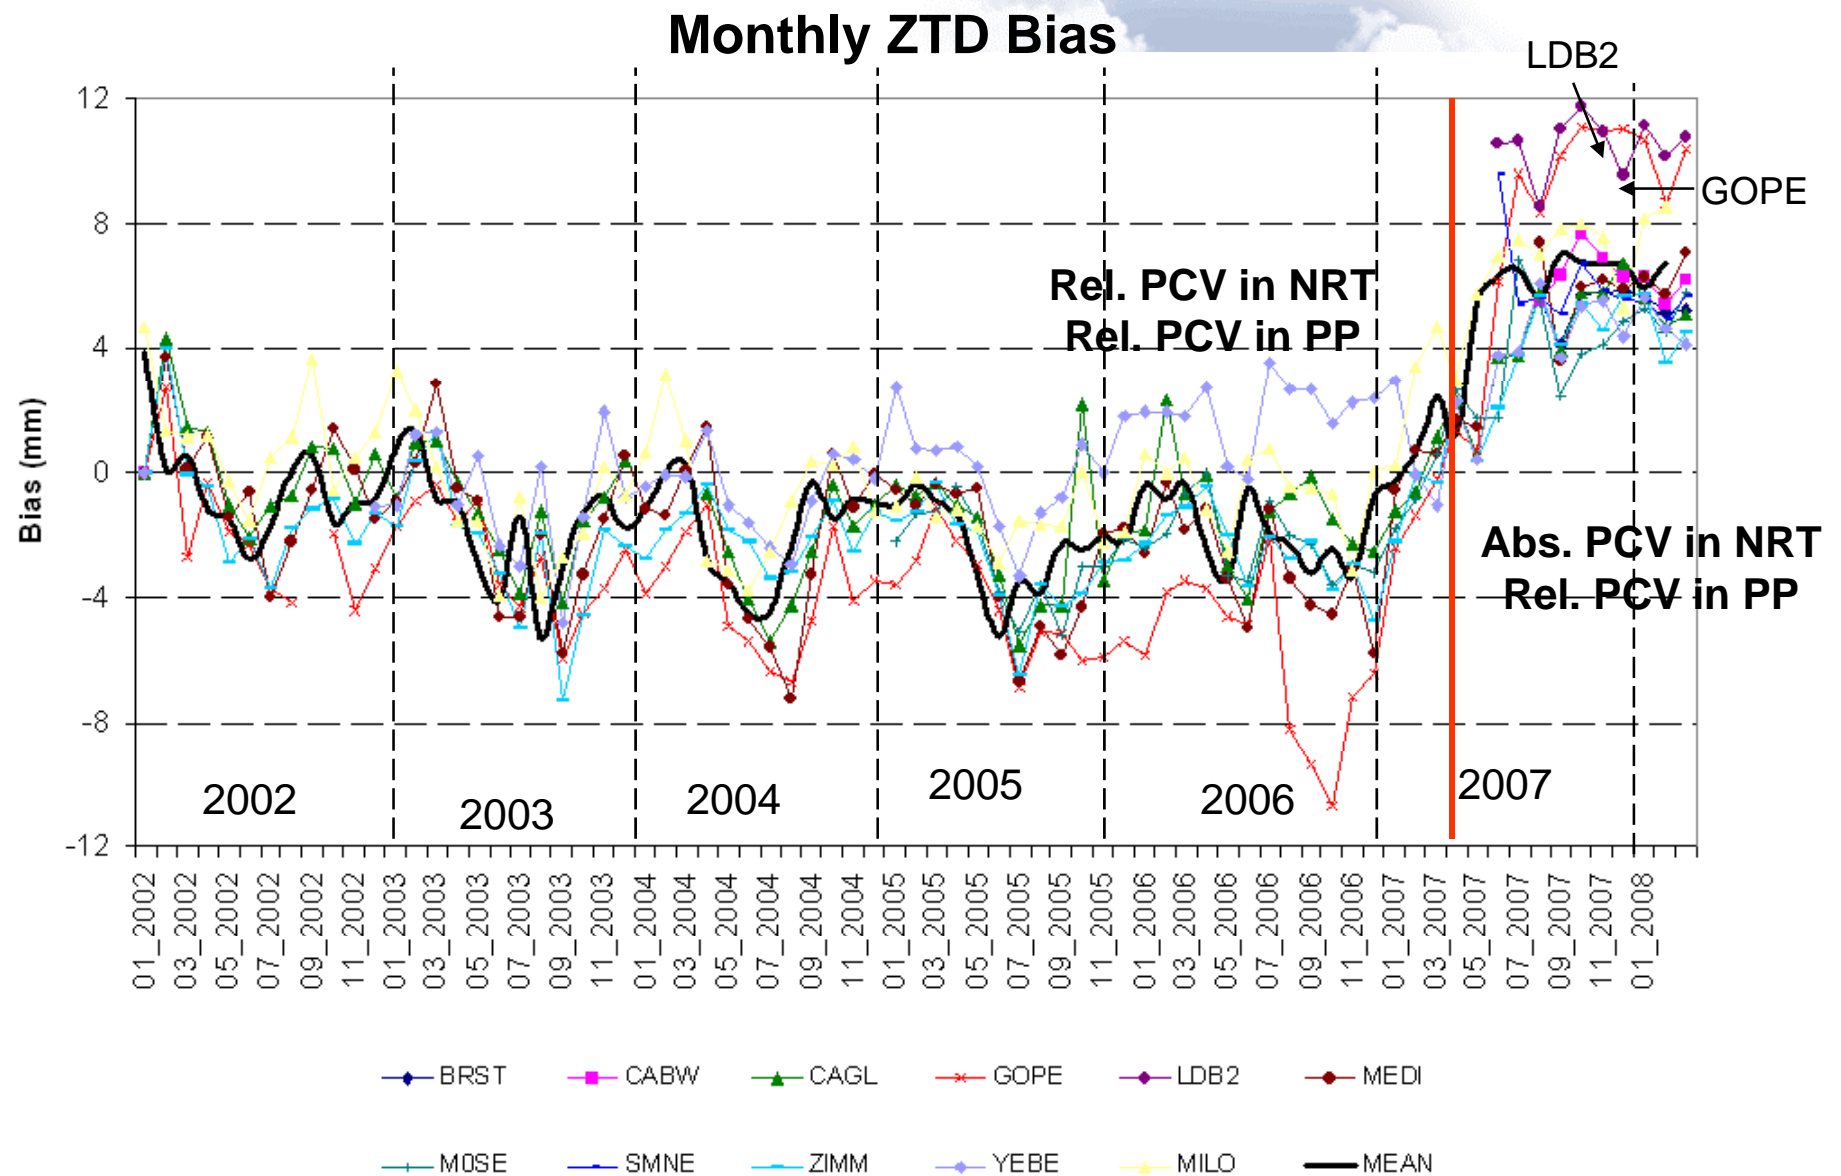

Each site is analyzed in NRT and Post-Processing which is necessary for site coordinate monitoring.

Height coordinate repeatability is a ZTD quality indicator.

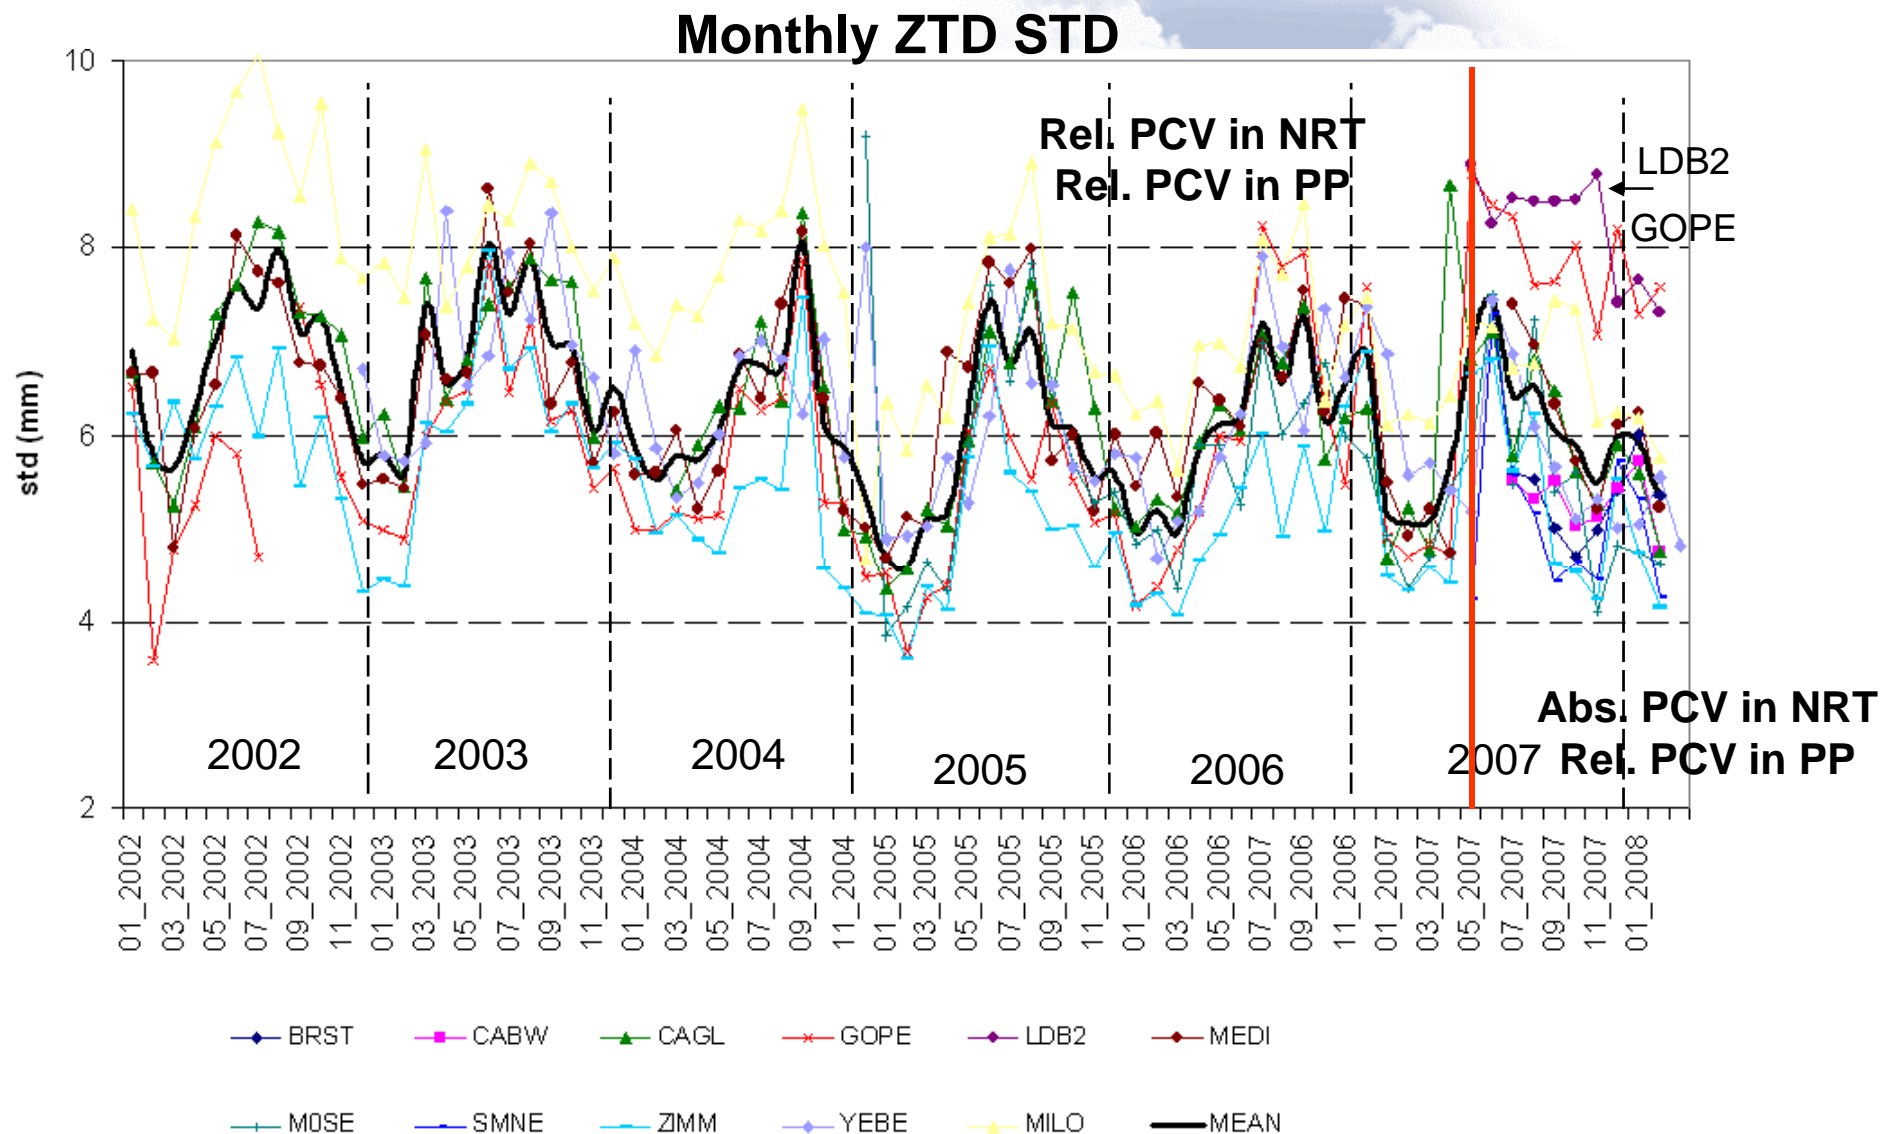

To get 0.45 mm IWV we need 3 mm ZTD that is 9 mm H.

Site	Receiver	Antenna & Radome	h (m)	PP Daily Coordinate Repeatability			Analysed since..
				East (mm)	North (mm)	Up (mm)	
BRST	LEICA GRX1200PRO	LEIAT504 NONE	2,043	5,0	3,8	6,7	May 2007

Super Sites: PP and NRT (1/2)

Super Sites: PP and NRT (2/2)

Super Sites GPS Internal Validation (Nov 2007– Mar 2008) (1/2)

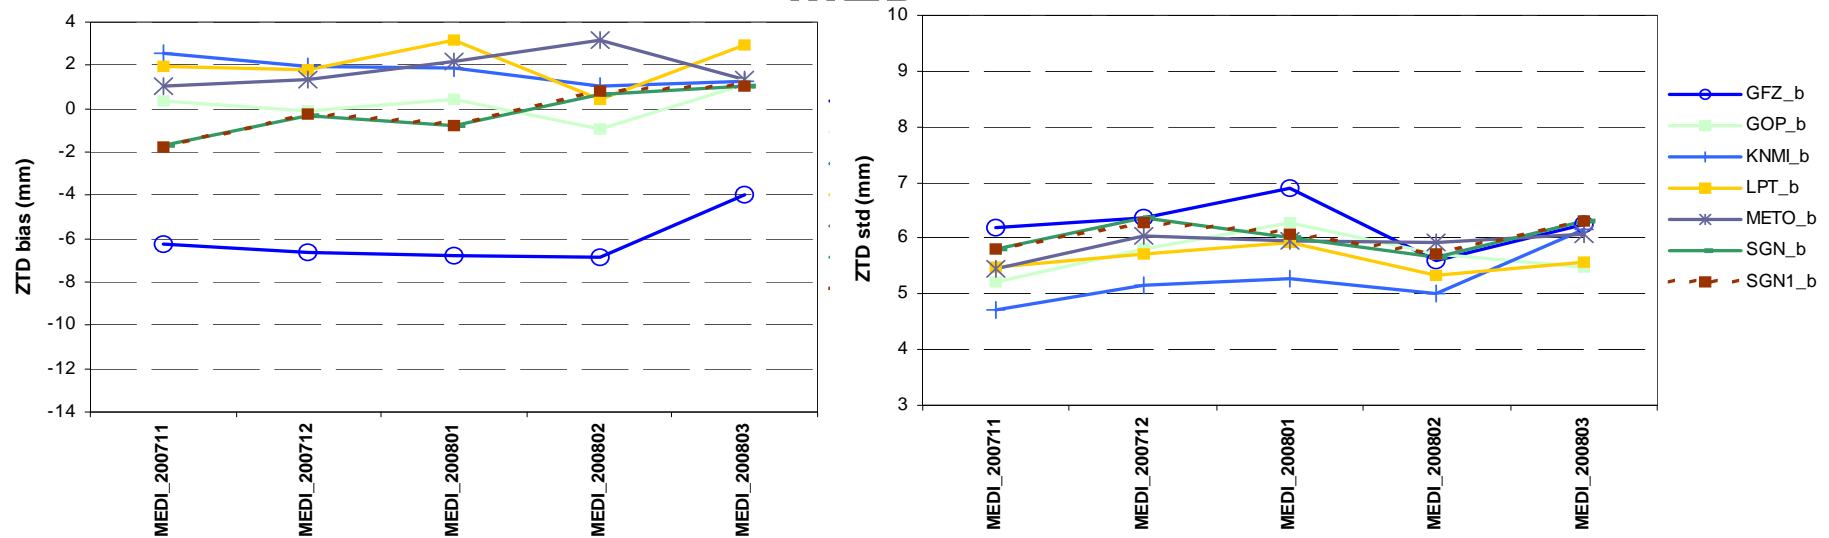

Pair wise comparison of individual NRT solutions over the whole period is done considering the ASI solution as the reference.

Examples are shown for MEDI, BRST and CAGL Super Sites

- the standard deviation ranges from 4 mm to 8 mm
- the bias ranges from -8 mm to 4 mm.

The larger bias (-10 mm/-12 mm) w.r.t GFZ is because GFZ is still applying relative PCVs

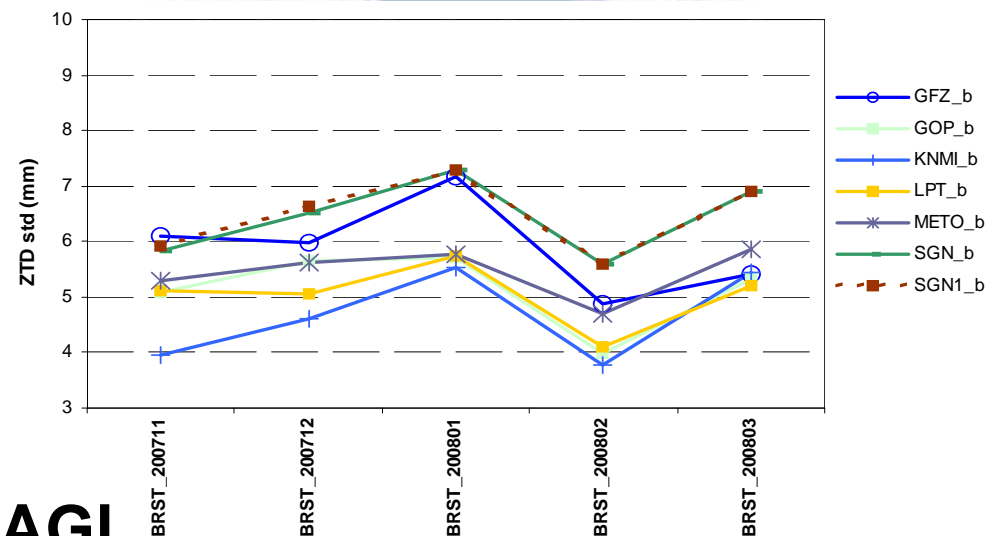

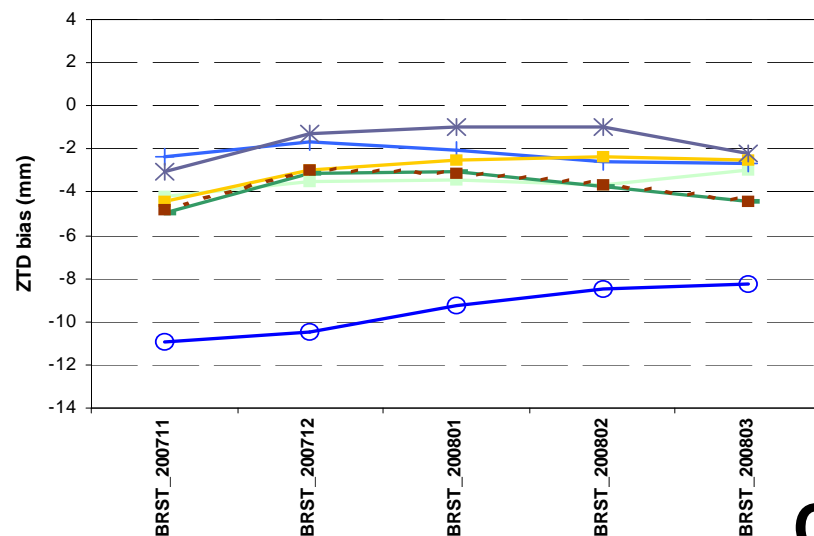

MEDI

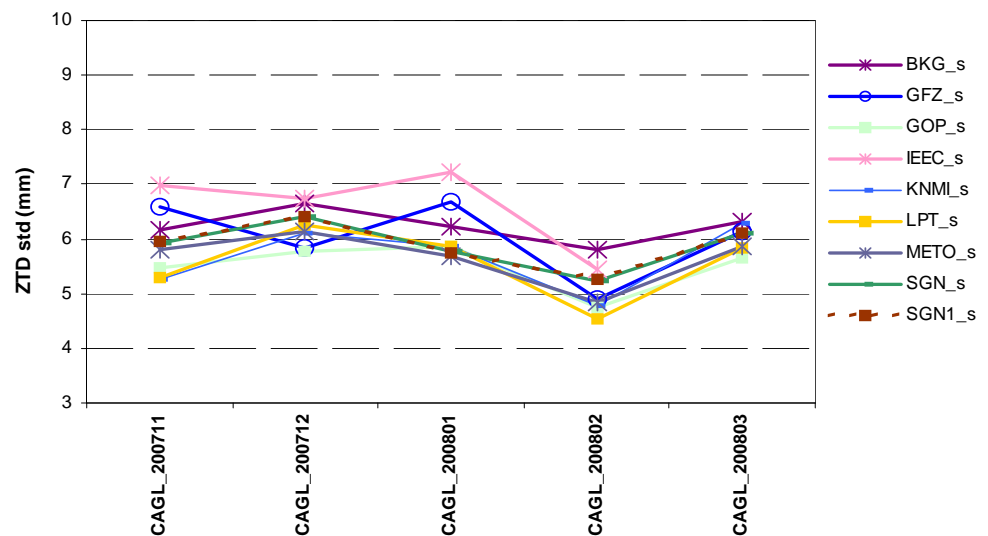

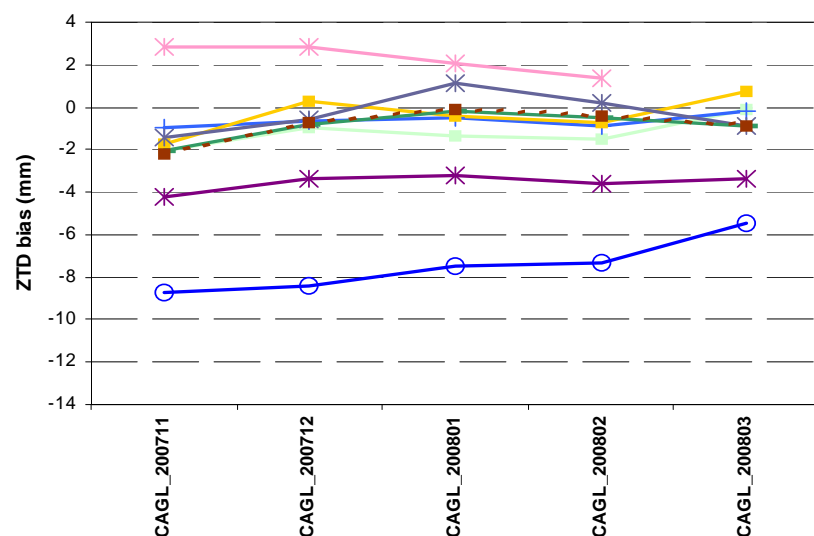

Super Sites GPS Internal Validation (Nov 2007– Mar 2008) (2/2)

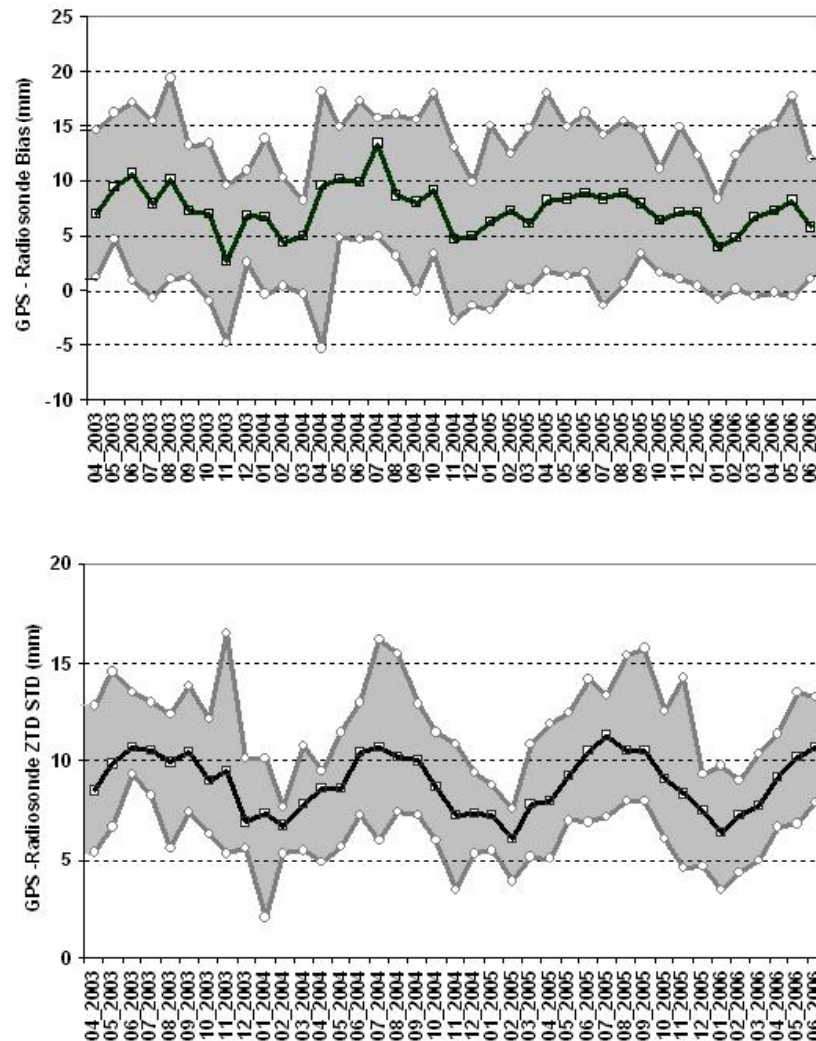

BRST

CAGL

Super Sites and Radiosonde (1/4)

$$GPS - RS > 0$$

Monthly variation in ZTD bias (top) and std (bottom) of GPS versus radiosonde for 13 stations (black line) using 'ASI TOUGH' ZTD estimates.

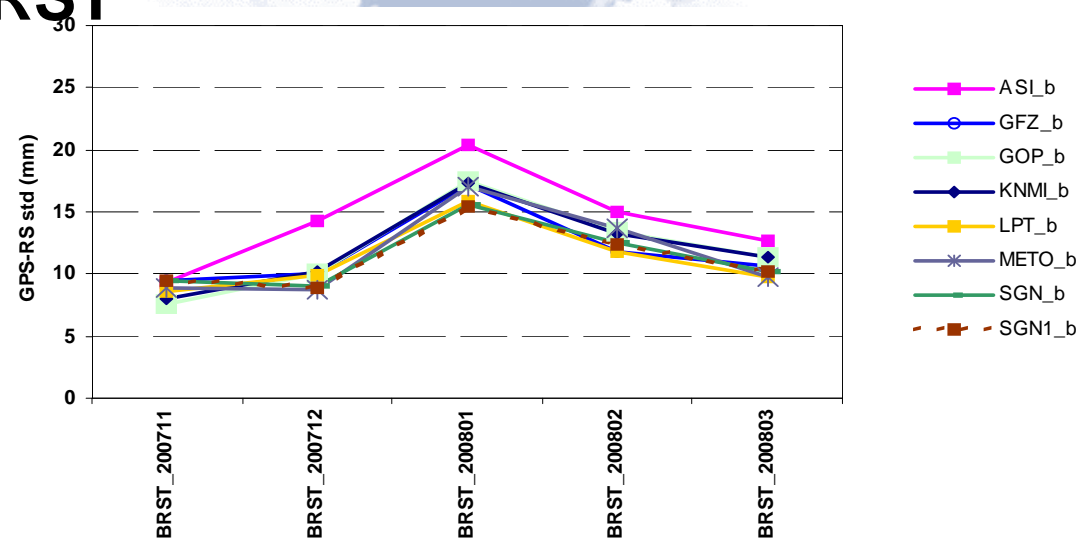

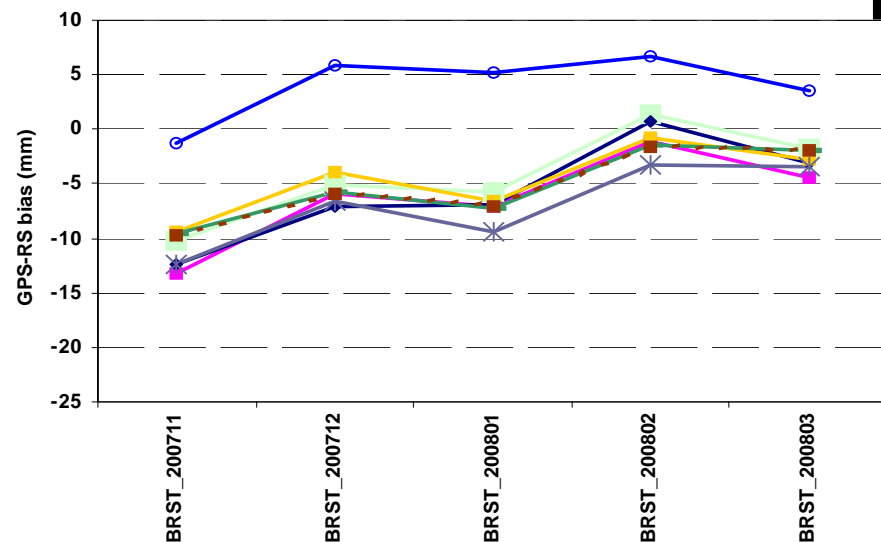

The gray area lies between the minimum and maximum values (*Pacione and Vespe, 2008, JTECHA, Vol. 25, No. 5, pages 701–714*).

$$5mm < std < 15mm$$

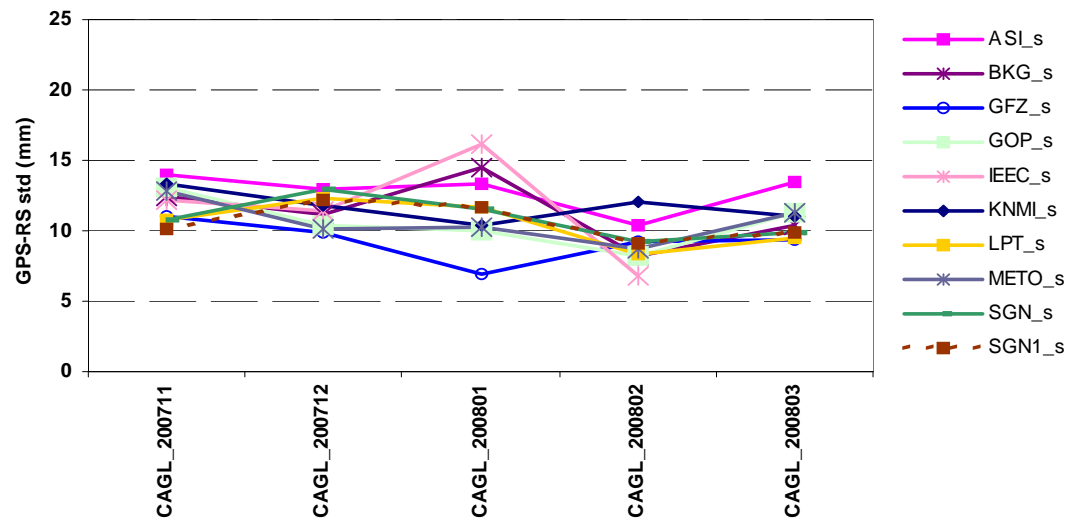

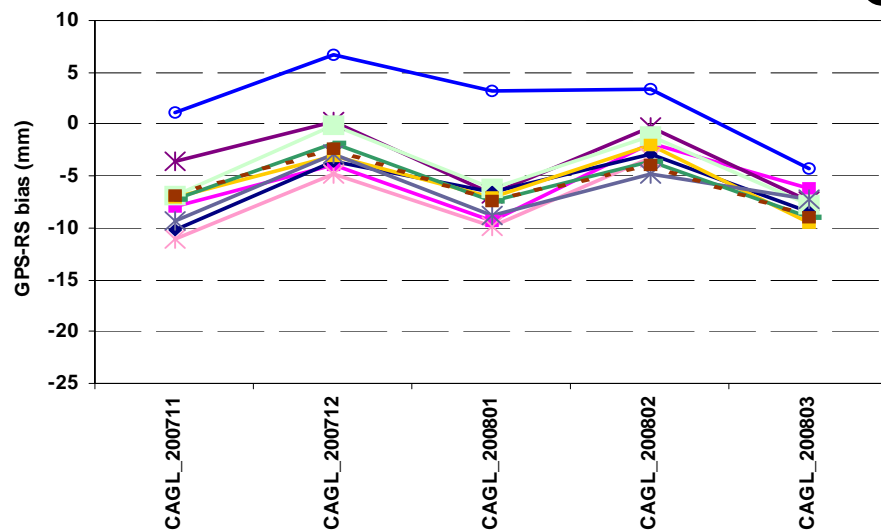

Super Sites and Radiosonde (2/4)

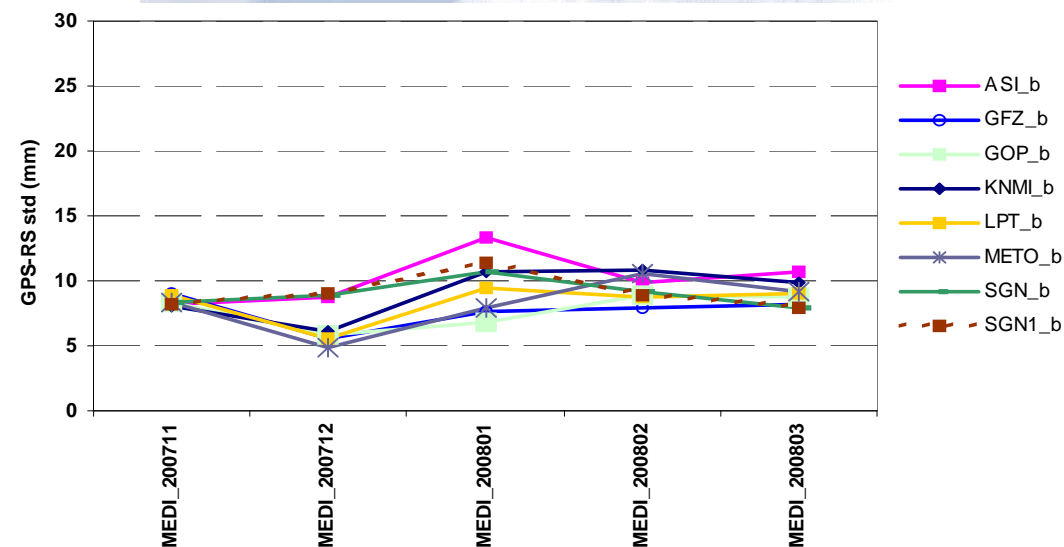

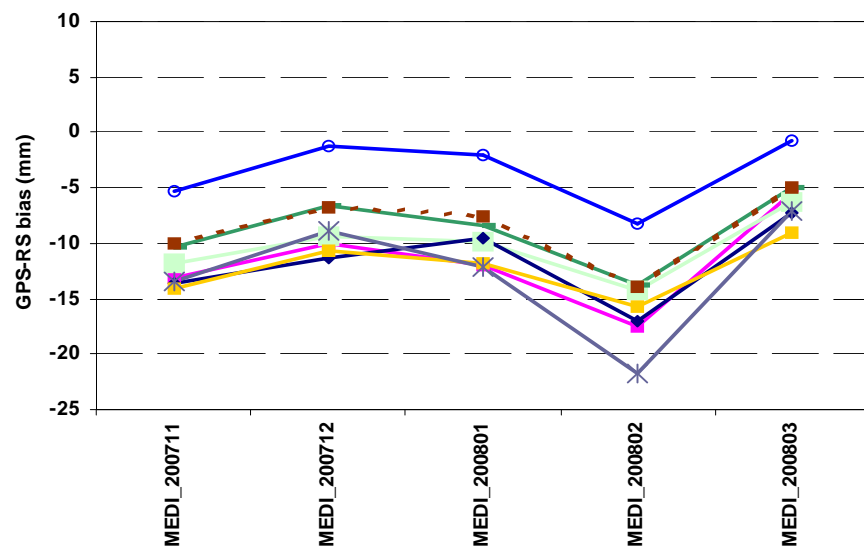

BRST

CAGL

MEDI

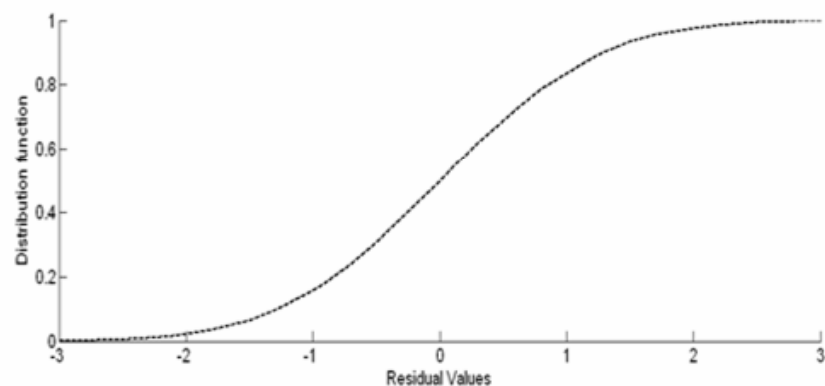

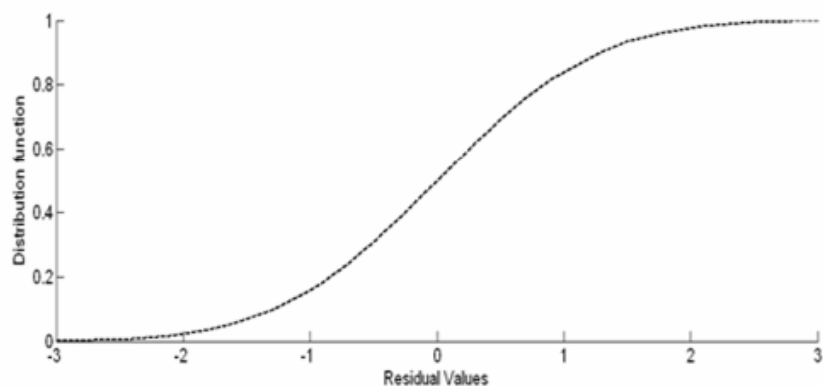

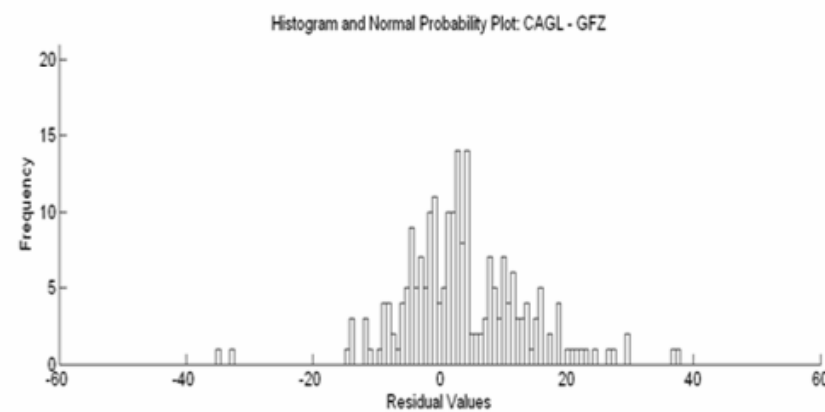

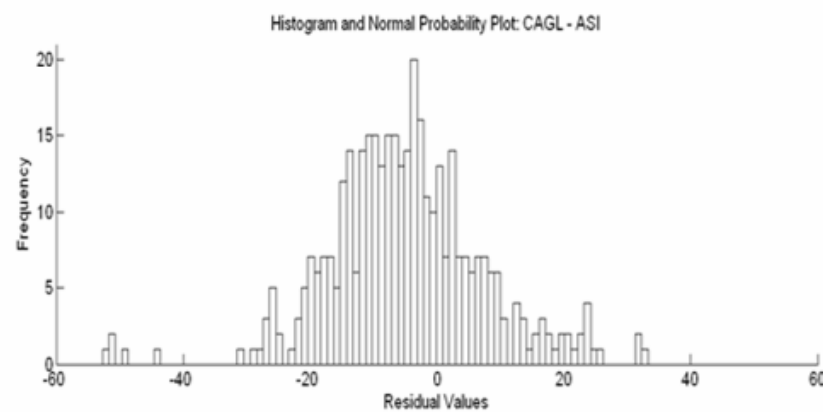

- The Sdt is in the expected range
- The Bias is now $\text{GPS} - \text{RS} < 0$, except for GFZ which is still using relative PCVs

Super Sites and Radiosonde (4/4)

For each Super Sites and AC a residual analysis has been performed. The obtained histograms are gaussian within a confidence level of 0.9, All the considered GPS estimates behave equally well w.r.t. the radiosonde 'truth'.

NRT ZTD Combination: a new ASI product

Combining different solutions of the atmospheric signal is a good way to detect problems in a single ACs and to provide a quality indicator (QI) for each solution. Meteorologists before indeed deemed the formal errors of the single AC solution a good QI. In *Pacione and Vespe, 2008, JTECHA, Vol. 25, No. 5, pages 701–714* . We have widely demonstrated such QI is not reliable

For a single site ZTD is modeled as:

$$y_n^k = Y_n + b^k + e_n^k \quad \begin{array}{ll} n = 1, \dots, N & \text{time epochs} \\ k = 1, \dots, K & \text{analysis centers} \end{array}$$

where Y_n is the ‘true’ ZTD at epoch t_n , b^k is the analysis center bias and e_n^k is the observation error. The equations can be solved for each epoch. Thus we have a rank deficiency which can be solved by adding the following constrain equation

$$\sum_k b^k = 0$$

ASI NRT ZTD Combination an example for CAGL and ZIMM March 2008

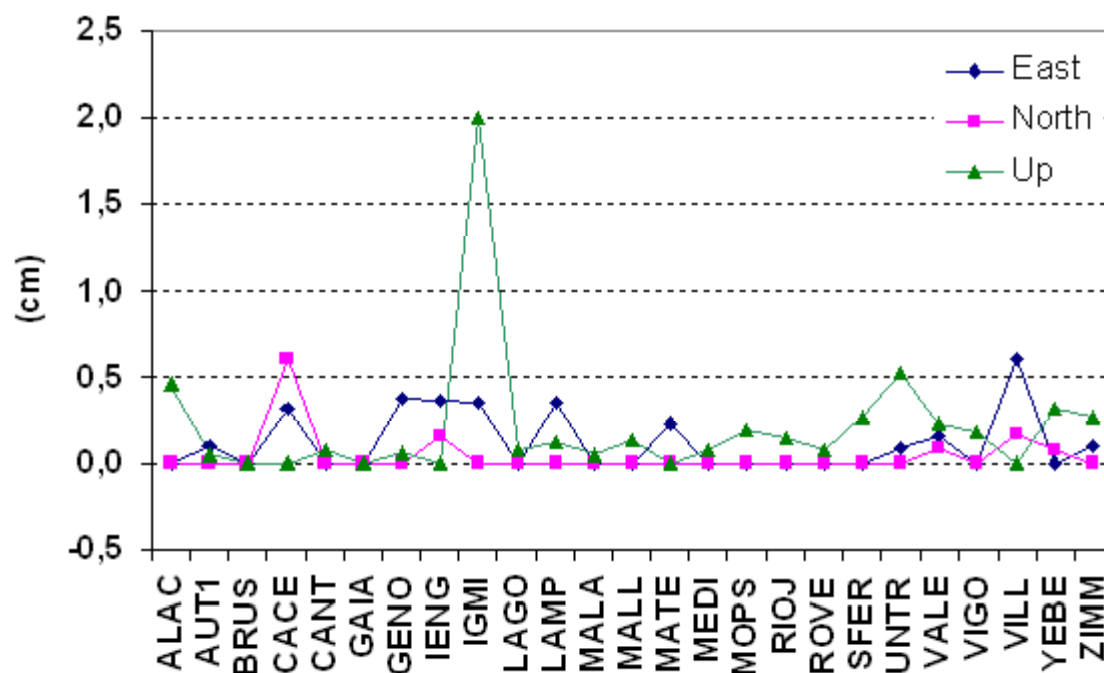

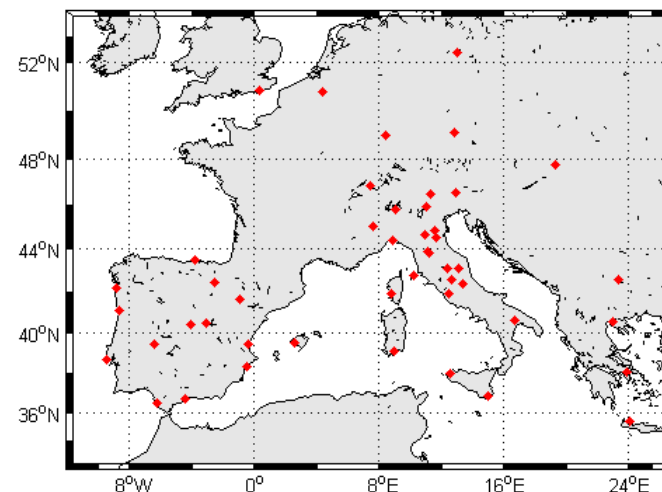

This product will be soon delivered to E-GVAP database

ASI NRT Site Coordinates Monitoring NEW!!

ASI delivers, together with BKG and LPT, site coordinates of ~40 sites to **EUREF** on hourly basis with the aim to establish a near-real time processing for a quick monitoring of the EPN stations.

Site performance is monitored with a delay of less than 2 hours.

Example of hourly residuals w.r.t EUREF (eurwwwmr.snx) weekly rapid solution. Site having 'large' residuals are detected and flagged. If the site belongs to ASI network an alert is send to the station manager.

We found this a good tool for site monitoring.

- GPS derived ZTDs are used operationally in Europe
- They have been extensively validated at ASI/CGS
- NRT ZTD combined products will be soon delivered to E-GVAP
- We plan to demonstrate the more robust reliability of the combined solution for assimilation purposes
- A Near Real Time Site Coordinates Monitoring system has been set-up and used as a tool for monitoring the site performance.
