der Wissenschaften  
2009

# Introduction

- Coordinates are dependent on:
    - Reference system realizations
    - Correction models (e.g. PCV [abs])
    - Analysis strategy
- } so are the orbits and ERPs
- Therefore inconsistencies in the coordinates (time series) are obvious if one of the above factors has been changed.
  - First global reprocessing initiative has been carried out by Potsdam-Dresden-Group for 1994-2006.
  - Currently the IGS is involved in the reprocessing of the global IGS network (REPRO1).
  - **Solutions of the EPN are strongly dependent on the products used! Therefore inconsistency are transferred by the applied products.**

# Evolution of the Initiative for the EPN Project „Reprocessing“

- Reprocessing activities have been started by several LACs of the EPN:

- **EPN related:** WUT entire EPN \*), ROB \*\*), BEK \*), SGO \*\*), DEO \*\*\*)
- **Others:** IGN , OLG, GOP, SUT

Products used: \*) PDR05, \*\*) IGS-final, \*\*\*) JPL-Products

- Six LACs indicated an interest to participate in a reprocessing initiative of EPN during the LAC workshop in Frankfurt 2008.
  - The analysis coordinator (BKG) confirmed to combine the reprocessed solutions (similar interest by SGO).
  - EPN Central Bureau would set up a dedicated data center with all the available data (RINEX).
  - Draft of a charter and presentation to the TWG in Budapest Feb. 2009.
- Establishment of a new EPN Project "Reprocessing" chaired by Christof Völksen (BEK).

# Participation

	LAC	Data Center
ASI (MicroCosm/ GIPSY)	X	X
BEK	X	
BKG	(X)	X
DEO	X	
GOP	X	
IGE	X	(X)
IGN	(X)	(X)
NKG (Bernese/GAMIT)	X	
OLG	X	X
ROB	X	X
SGO	X	
SUT	X	
SWISSTOPO	X	
WUT (BERNESE/ GAMIT)	X	

Each LAC will participate in the project Reprocessing!

More contribution than in the standard EPN processing can be expected:

- software
- analysis strategies

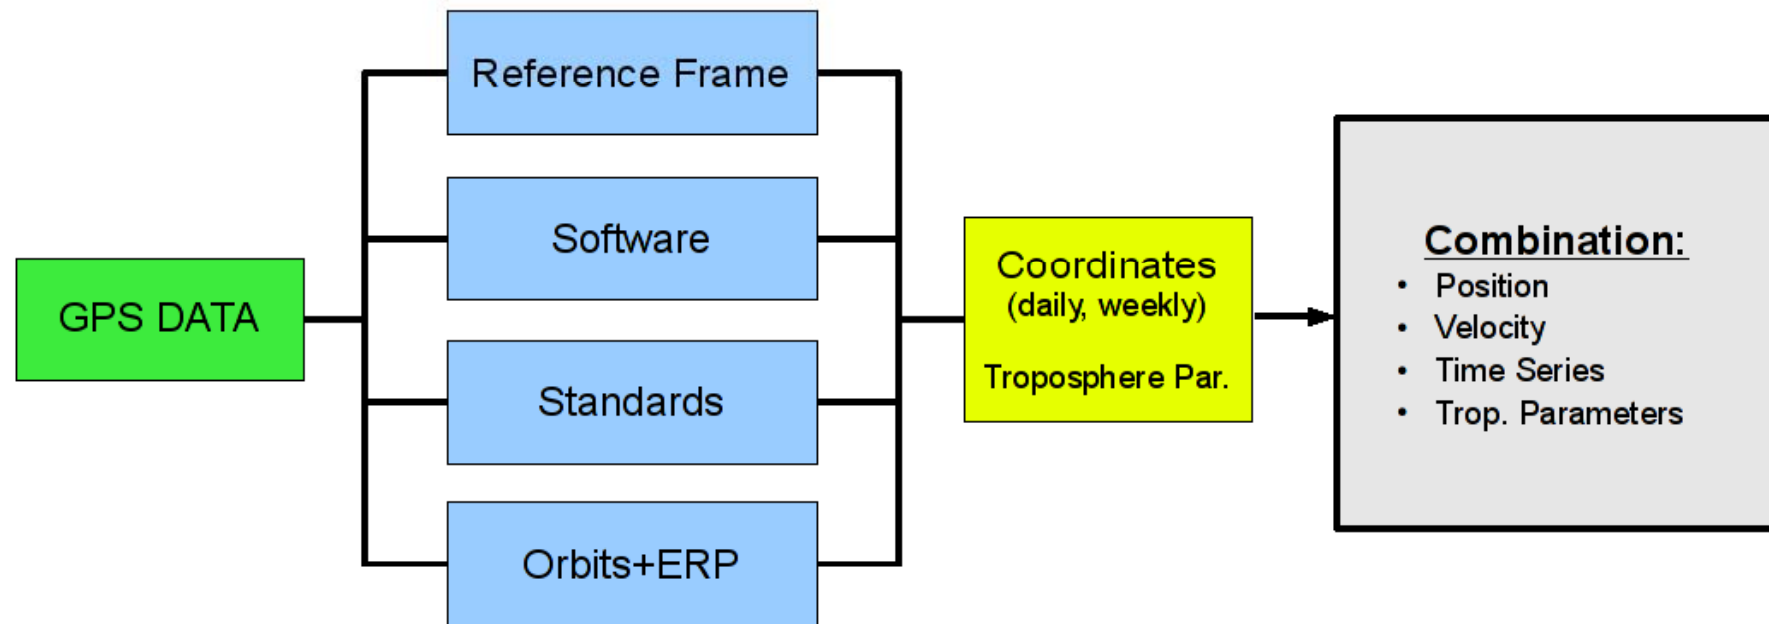

**Very positive resonance by the different LACs!**

# Processing Flow

## Analysis

# Software

For the reprocessing activities of the EPN different software packages would be available:

- BERNESE 5.0 (8), MicroCosm 2007.0 (ASI), GIPSY/OASIS (ASI, DEO, BEK?), **GAMIT**(WUT/NKG)?

Different software packages will foster the discussion on the best analysis strategy.

- Tropospheric mapping function (e.g. VMF, GMF - GAMIT, BERNESE: near future GMF/GPT, etc.)

Different approaches for the comparison are possible:

- Sub-network (e.g. BERNESE) by sub-network (GAMIT) or
- EPN (BERNESE) by EPN (GAMIT) (also GIPSY / MicroCosm)

# Standards

Standards have to be defined beforehand (task of the WG).

- Application of abs. PCV (type mean or individual calibrations)
  - Conform with the IGS
  - "Best available" (individual calibrations), (much) later near-field
- Mapping functions to be used (available in all software packages to be used)
  - NMF, GMF, IMF or VMF
- Datum realization
  - Regional (e.g. define selected reference sites)
  - Global approach (see Legrand & Bruyninx 2008)
- Exchange of solutions?
  - Standard SINEX (coordinates and covariance matrix)
  - SINEX including NEQ (soon to be released by BERN)

# Input - Products (ORBIT+ERP)

For the coordinated reprocessing activities of the EPN the best available products should be used.

Available are:

- PDR05 (of the Potsdam-Dresden-Group) (<http://iscd.gfz-potsdam.de>)
- Reprocessed orbits by the different IGS analysis centers are available at CDDIS: (<ftp://cddis.gsfc.nasa.gov/pub/gps/products/week/repro1>)

Combined reprocessed IGS final are yet not available and cannot be expected before the release of the ITRF08 (probably by the end of 2009).

GLONASS orbits are **not** included in the reprocessed products!

→ Currently only the PDR05 products cover a sufficient large time span to reprocess the entire EPN (1994-2006+).

# Working Plan (Pilot Phase)

- Establishment of a working group "Reprocessing" that coordinates the multiple task of this project.
- Redistribution of the EPN sites with the focus on redundancy (preferred 3 LACs for each site?).
- Selection of suitable sets of reprocessed products as input for the first analysis of the 2006 data (**pilot phase**).
- Each participating LAC shall setup the facilities for the reprocessing of the 2006 data.
- Development of a common strategy to be used by all participating LACs. (e.g. current EPN-Strategy)

# Time table "Pilot Phase"

# Working Plan (after Pilot Phase)

- Analysis of the complete EPN data set (1996-200x) applying the new strategies and standards.
- Analysis of the daily/weekly coordinates by the participating LACs and supplying the results to the analysis coordinator.
- Combination of the different solutions by the analysis coordinator, reports and feedback to the working group and the LACs.
- Estimation of reprocessed coordinates and velocities for the entire EUREF permanent network.

# Conclusions

- Reprocessed coordinates are consistent according to
  - the applied standards (models, software, analysis strategy),
  - reference system realization and
  - used products.
- Each LAC will establish "reprocessing capabilities".
  - Management of large data sets will allow to improve, based on the long time data sets, the reference system realization (ITRF08, ITRFxx..).
  - Reprocessing capabilities will also be used on smaller regional networks (national level - as already done).
- Long time geodynamic studies will certainly be improved due to the consistent time series.
- Reprocessing will probably become an important part of the analysis of GPS data for the coming years (Repro x).
